

PM-585 and PM-586

Special Instructions for Masking

BBJ SATCOM Antenna

1. It is important, when installing any Polyurethane Erosion Mask, that the material be firmly glued to and supported by a solid surface. If the material is placed over a void or hole, it will work harden and eventually a piece will break out.

2. The BBJ SATCOM antenna is protected with a mask for the Bullet and a separate mask for the Base Fairing. Each portion should be trimmed close to the point of separation so the bullet can be removed without disturbing the mask installation. The mask should not span the line of separation where it could not firmly adhere to the substrate.
